

Ethical Hacking Task 01 - Reconnaissance Report

Target Information

Website: GitHub

URL: <https://github.com/>

Reason: Public website used for passive reconnaissance.

WHOIS Lookup

Document the domain name, registrar, registration date, expiry date, name servers, and domain status using a public WHOIS service. Insert your screenshots here.

DNS Enumeration

Collect A, MX, NS and TXT records using a DNS lookup tool and insert screenshots.

Website Technology Identification

Observed technologies include HTTPS, CDN, and modern web technologies used by GitHub. Record the exact findings from your technology detection screenshot.

HTTP Security Headers

Check for Content-Security-Policy, X-Frame-Options, X-Content-Type-Options, Strict-Transport-Security and Referrer-Policy. Add your screenshots.

Robots.txt & Sitemap

Review robots.txt and sitemap.xml and summarize what they reveal about crawling and indexing.

Overall Observations

Passive reconnaissance reveals publicly available information that helps understand a website's infrastructure without exploiting the target.

Conclusion

Reconnaissance is the first phase of ethical hacking. During this task, publicly available information about the target website was collected using ethical and passive techniques. WHOIS, DNS records, website technologies, HTTP security headers, robots.txt and sitemap.xml help security professionals understand the target environment before any security assessment. This exercise improved my understanding of information gathering, the importance of secure configurations, and the role of passive reconnaissance in responsible penetration testing.
